Abstract:

Attractive interfaces and security aspects go hand in hand in modern day mobile and web applications. Hence we ventured out to implement these concepts in the mainframe CICS environment (known as BIG IRON). Circle interface provides a rich visual interface and also has an added advantage which helps the user to know the most recently and the most frequently accessed application/page. The features such as security image and password locking covers the security aspects of our application. This kind of application offers an efficient and secure package to the user which helps in achieving customer delight. Hence in this paper we have provided our inputs for developing user-friendly yet secure interface which enables mainframe to be used for various front end applications.
